

The WIZER: intelligent Winding and Separation System

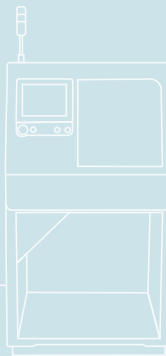

The WIZER intelligently separates a roll of pouches into separate sections and automatically winds and seals these per patient.

The system can wind patient specific rolls starting from 8 pouches and wind sections up to 20cm in diameter.

The WIZER processes are managed from the information of the APMC database. Ideally the WIZER is placed after your automated inspection and re-inspection processes like the VIZEN or VIZEN PRO.

The WIZER is ergonomically designed and is easy to use. The WIZER has a small working area and can be operated as stand-alone, in an area separated of your other production processes. This makes it an attractive investment to finish the process from pouch blistering to patient specific medication rolls, ready for distribution.
